Manufactured by

MANAMED™

**Manamed provides a suite of orthopedic solutions to improve outcomes and provide a better patient experience. With PlasmaFlow, Manamed is helping patients recover more safely at home**

## Blood Clot Prevention

Deep vein thrombosis (DVT) is the formation of a blood clot within a deep vein, typically in the thigh or calf. Patients undergoing orthopedic surgery are at high risk for DVT after their procedure due to inactivity or prolonged bed rest. If a blood clot breaks free, it can travel through the bloodstream and reached the lungs. This is a serious medical emergency call pulmonary embolism, which can block blood flow from the lungs and heart, and even cause death.

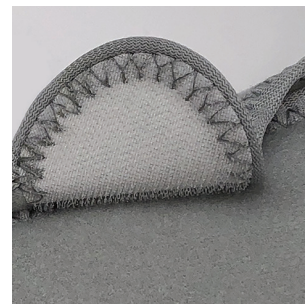

Your doctor will likely prescribed a program to help prevent DVT after your surgery, including medication and or a Compression device like PlasmaFlow to help promote blood flow back to the heart and prevent blood pooling.

## Why PlasmaFlow?

PlasmaFlow helps prevent the onset of DVT with a convenient home therapy. It offers best-in-class battery life, LCD displays to monitor pressure and complete portability—no tubes, cords or hoses.

### Hook & Loop fasteners

Adjust quickly and securely over a leg for a custom fit.

### Easy 1 button Operation

Turn unit on and switch between 2 modes at the push of a button.

### Visual Display

Shows up to the hour timer, mode and pressure level.

### Recharge Warning

Blue light above Power button glows when charged, becomes red light when charge is needed.
